

A clinical study for people with Alopecia Areata (AA)

Sponsored by

What's Alopecia Areata?

AA is a condition characterized by the loss of hair in small patches. The condition develops when the immune system attacks hair follicles, causing hair loss on the scalp, face, and sometimes on other body areas.

Reasons to participate

- Potentially get access to the oral, once-daily, investigational drug at no cost
- Access to a dedicated study team
- Help advance AA research
- You may be eligible to join an extension study and receive the investigational drug

Is the study right for you? The answer may be yes, if you

- Are between 18 and 70 years old
- Have AA
- Have hair loss on your scalp that covers at least 50% of your scalp.
- Current hair loss episode has been lasting for more than 6 months, but less than 8 years

How long would be my participation in the study?

If you take part, you could be in the study for just over 1 year, and you will visit the study center up to approximately 15 times for study assessments

What else do I need to know

You'll get complete information

The study team will explain the possible benefits and risks of the study.

Care and medication provided

All investigational drug and study-related care will be provided to you at no cost.

Investigational drug vs placebo

You will have a 2-in-3 chance of receiving the investigational drug and a 1-in-3 chance of receiving the placebo (inactive pill).

Participation

You may be able to participate in the second part of the study where all participants will receive investigational drug (no placebo).

What is the goal of the study?

- The goal of the study is to assess the benefits and risks of the investigational drug to see if it will help patients with AA.
- All investigational drug and assessments will be provided to you at no cost.
- This investigational drug has been tested in other autoimmune conditions.
- You may be compensated for your time and travel.
